The name Photoshop is used as a verb because images can be deleted, moved, and manipulated in a similar fashion as the common verb "to Photoshop." For example, "Can you Photoshoot that?" meaning "Can you manipulate that photo like a pro?" History Photoshop originated in 1992 as the product of a team of software engineers at Macromedia. It was designed as a feature-rich editing tool with vector graphics support for the burgeoning world of the World

Wide Web. While many of Photoshop's components have remained similar over time, its overall usage and features have evolved significantly. The 1st generation In 1993, Photoshop introduced several major improvements to the technology behind image editing. These were all foundational components in the design of Photoshop. The software included an enhanced screen layer system, which enabled the creation of new layers that supported transparency. In addition, it implemented a "painter's pallet" that enabled coloring with gradient fills and adjustment layers. Adjustment layers are the cornerstone of Photoshop's power. Finally, the developer introduced layer channels, which allowed for layer reuse. The greatest advantage of layers was that users could adjust several layers at once. To do so, users would group different image content layers and enable advanced editing by clicking on the group. Layers can have anything

from a simple color adjustment to complex content selection and conversion. It introduced a couple of additional features for its mass of users; it made a greater range of adjustments possible and allowed more features to be stored. The 2nd generation The Photoshop team moved on in 1994 to develop the second generation. This was to become a powerful tool to handle the increasingly complex graphics that the Internet was creating. Later that same year, the developer released version 2.0 of Photoshop.

This contained much of the foundation technology that would be included in future versions. Color management and LAB color space Photoshop 2.0 also included the ability to manage color consistency with a proprietary color management system called ColorSync. ColorSync now enables users to convert between color spaces and produce accurate color regardless of platform. The 2.0 release also introduced the concept of layers and channels to

create robust edit files. Layers allowed users to group images into separate files and work on each of them independently. They also supported embedding files into them. By 2007, the company introduced the ability to create channel masks, which

Lycopene is an organic compound that is present in fruits and vegetables, such as tomatoes and watermelon. Lycopene has been found to be important in the prevention of cancer and has other beneficial physiological properties. The most well known way to deliver lycopene to a human consumer is in the form of a tomato-based sauce. Typically, this sauce contains at least 5% of lycopene in the form of conjugated unsaturated fatty acids such as linoleic, linolenic, and docosahexaenoic acids. In contrast, the amount of beta-carotene in foods is typically less than 0.1%. Beta-carotene is a naturally occurring carotenoid pigment present in corn, carrot, squash, beet, spinach, and other green vegetables. It is the precursor to other carotenoids that are more stable. It has antioxidant activities and has been found to be

protective against cancer and other diseases. Others have disclosed various methods of preparing lycopene-containing foods. Most of these methods involve processing or pasteurizing ingredients in which lycopene naturally exists, such as during the growing or processing of tomatoes, watermelons, eggplant, etc. There are many well-known methods of preparing beta-carotene-containing foods, such as canning the ingredients, cooking them, or mixing them with oil and processing the oil. See, e.g., U.S. Pat. Nos. 4,373,919, 4,515,853, 4,518,770, 5,135,757, 4,820,642, and 5,223,520. In contrast, the only methods for preparing lycopene-containing foods that have been developed in recent years are the addition of substances to foods, such as oils or lecithins, that enhance the stability of lycopene, thus allowing a consumer to obtain an increased amount of lycopene from a food product. For example, U.S. Pat. No. 4,503,157 discloses a

method for increasing the amount of lycopene in the juice of tomatoes by using an emulsion of a lecithin with water and adding it to the juice along with the product to be processed. U.S. Pat. No. 4,849,433 discloses a method for increasing the amount of lycopene in a tomato sauce by adding an oil, such as fish oil, to the tomato sauce

Normally, when Chinese Internet giants and mobile network operators agree on a new set of rules, you would expect them to favor the customer. But not this time. According to ChinaWire.com, the telecoms want to protect their interests when a new cross-provider data sharing agreement is negotiated. To do this, they have convinced a number of Internet companies to join them in forming an "anti-Google" lobby. The United States has long been concerned about China's internet and web censorship, particularly after Google and other companies were blocked following Beijing's successful cyberattacks in 2009. The Chinese government has issued a block list of which websites are allowed and which are not. This has resulted in

Google's search engine showing "no results" for many keywords, but some key search operators such as Baidu have an index that is often more useful than Google's. But with the Chinese government keen to claim credit for the discovery of a cure for Ebola, the hand-wringing over who is controlling access to online information has increased in recent months. A number of internet companies have announced moves to protect user privacy and data, but the telecom
