However, the disadvantages of N-PLGA microparticles are that the fabrication is complicated and difficult to scale up.[@CIT0061] Therefore, modifications of N-PLGA microparticles can be useful to increase the loading and drug release efficiency and to make the particles suitable for oral administration.

Conclusion {#S0005} ===== Our study proved that N-PLGA microparticles can enhance the dissolution rate of aspirin and are an effective drug carrier to enhance aspirin absorption by improving dissolution. The in vitro dissolution of aspirin from the different N-PLGA microparticles was not comparable to the dissolution profile of aspirin in the acidic gastric solution. However, after gastric emptying, the concentration of aspirin is higher in the acidic gastric solution and lower in the N-PLGA microparticles. Furthermore, our results showed that the in vitro dissolution of aspirin from different N-PLGA microparticles are significantly improved with the aid of esomeprazole. This study concluded that the enhanced dissolution of aspirin from N-PLGA microparticles is due to the dissolution of N-PLGA microparticles themselves and the integrity of the PEG layer. This research, therefore, proves that aspirin-loaded N-PLGA microparticles enhance drug dissolution and the dissolution rate is enhanced by esomeprazole. Therefore, this can improve the therapeutic efficacy of this drug. Finally, in vivo investigation of the therapeutic efficacy of aspirin-loaded N-PLGA microparticles is required to establish their application in the treatment of gastritis.
