A command-line-based FTP-transfer-utility Features: Installation instructions: Installation can be performed through adding the program to the autostart directory of Windows. The application doesn't include a readme file. Basic system requirements: The CMD-based ftpdmin application has no system requirements. Theft deterrents: One major disadvantage, generally, with FTP solutions is the slow transfer speed. Still, in this particular case, there are other, far more important, problems to deal with. There is little in the sense of security being done when using ftpdmin. In fact, you shouldn't, by all means, transfer important or sensitive documents. This app was created for users who want to transfer small and harmless files over FTP. What's New in this version: Corrected typo in the application name Fixed incorrect help message Corrected incorrect file handling Fixed incorrect hardcoded IP address Disclaimer: DoubleR Software helps companies to reduce the cost of software distribution by providing ready-to-run installation packages for small and medium-sized companies. These installation packages provide a convenient solution for companies that need to quickly deploy updated or additional copies of software. The distribution packages can be ordered under the support and maintenance agreement for DoubleR Software. The application is easy to operate, especially if you've dealt with the CMD system before and know what to expect when launching an application from within the command-line tool. There aren't any options to be set. The program will display the created FTP server address in order for the other computers to be able to connect with yours, wirelessly. From here on in, transfers should be a total breeze. One major disadvantage, generally, with FTP solutions is the slow transfer speed. What's New In?

There are so many FTP solutions, but many of them don't do a whole lot, besides connecting to your own server. That is, they just do the basic task of letting you have the ability to transfer files. ftpdmin is one particular tool that adds a ton of features and functions to this basic file transfer process. Your transactions are always safe. ftpdmin is quite a security conscious software, due to the fact that the application was created to be used with a home network. No sensitive files are at any point in danger of being accidentally transferred to the wrong place. The application comes with a few security options and options that keep your information at safety. For example, the author thought of the idea to have a password generated for every new account, in order to keep things on track. This will assure you that you are safe, and no unauthorized party will ever get access to your data. Another great feature is the ability to transfer files from local folders. This can be done in a few clicks, using only the ftpdmin application, and you won't have to worry about the existence of a connection, or needing to use the CMD system, in order to achieve this. There is no need to run two or more applications simultaneously, or have to worry about certain situations, in order to transfer files from your computer to another. The program can be configured to act as a local FTP server, when one of the computers uses a computer ID, or domain name, to connect. Your network is protected, in a completely different way than before. When you are logged into the ftpdmin application, you can decide to make a backup of your data to your chosen destination. This is a very useful feature, if you don't trust your hardware and aren't quite sure whether it can store a back-up. The process is quite simple, as the application was written with security in mind, and is designed to help you protect your files. The data is not transferred directly to the ftpdmin server, but is instead used to connect the computers together. There are many situations where you might need to get files from one computer to another and couldn't possibly use cables. You might need to transfer files between machines, that don't have internet access, in order to share your documents. You could have done this with a flash drive, but in this particular case, ftpdmin might be the best choice for you. It can connect to your own computer, and will also act as a local FTP server, since it has an IP address. This is the perfect solution, when you have an FTP server in mind, but are not quite sure whether you want to use a CMD-based program, or not. This app should be able to do the trick for you, in this
